1. Proper application and function of closure requires that variations in the other diameters of the locking ring shall be uniform, those of A subject to such variations as normal manufacturing conditions require. This also applies to the locking ring profile illustrated which is considered ideal.

2A. It is important the 'C' dimension at the top of the opening adjacent to the sealing surface not exceed .720.

B. Minimum 'I' dimension is for filling tube clearance and extends throughout the entire length of the finish and the bottle neck.

3. Certain capping equipment requires that neck contour be within limits of recommended cage contour.

4. The inner lip contour is subject to normal manufacturing variations. Radius 'R' is not to exceed .047 when 'C' is at maximum.

5. It is the responsibility of the glass container purchaser to consult with its closure and container supplier to determine the appropriate pressure limits for the combination of the container, its finish and the closure chosen, when the container will be subjected to pressure or used for contents under pressure.

6. Refer to Glass Finish GPI-015 for optional sealing surface construction.

7. The alternate contours for the reinforcing ring are optional provided the specifications of the locking ring and other dimensions are observed.
